Abstract:【Objective】Kiwifruit is known as the “King of fruits” because it is rich in dietary fiber, vitamins, protein and minerals. The market for kiwifruit at home and abroad is huge. China is the world's largest kiwifruit production and consumption country. In recent years, planting area of kiwifruit has expanded rapidly in Guangxi, Yunnan, Guizhou, Jiangxi and other economically underdeveloped provinces (regions) in southern China. However, the fruit quality varied with areas of planting. Therefore, improving the quality of kiwifruit is an important task in these areas. Aromatic characteristics are the most important characteristics for kiwifruit quality and are the main concern to consumers. Hongyang is the main variety of kiwifruit grown in Guangxi, but there were few reports on the trend performance of Hongyang in different producing areas. The aroma components of Hongyang from 19 growing regions of Guangxi were determined in order to provide reference for selecting suitable areas for growing kiwifruit in Guangxi. 【Methods】Fruit samples were collected from 19 growing regions in Guangxi. fruits were harvested when the soluble solid reached 7 Brix. The aroma components of fruit were determined by headspace solid phase extraction (HS-SPME) and gas chromatography-mass spectrometry (GC-MS). The extraction head was 30 μm PDMS/DVB SPME. The data were statistically analyzed by SPSS.19.0, and Origin 2018 was used for heat map. 【Results】 A total of 71 aroma components were detected from the 19 regions, including 26 esters, 24 terpenes, 4 alcohols, 4 aldehydes, 2 ketones, 2 C13 compounds, 2 C6 compounds, and 7 alkenes. The fruits produced in Leye County of Baise City had the most abundant aroma components, with 26 kinds of aroma components detected, followed by Gongcheng with 24 kinds of components detected. The aroma components of the fruits produced in Dongshan of Quanzhou County in Guilin City were the least, only 9 were detected. The most regions had aroma components ranging from 16 to 20 kinds. The main aroma types of kiwifruit were esters or terpenes, the esters accounting for the total aroma of Hongyang from the 19 regions had large difference, ranging from 8.3% to 99.4%. The terpenes accounting for the total aroma of Hongyang from the 19 regions also had large difference, ranging from 0.5% to 80.9%. Esters was accounting for over 50% of the total aroma in the 12 regions, and terpenes accounting for over 50% of the total aroma components in the 7 regions. The high content of aroma components in Hongyang were ethyl butyrate, methyl butyrate, ethyl caproate, methyl benzoate, ethyl acetate, and eucalyptus, etc. The total aroma content of Hongyang fruits from the 19 regions ranged from 32 to 215 $\mu\text{g} \cdot \text{kg}^{-1}$, among them, the fruits from Rongjiang Town of Xin'an County, Guilin City had the highest aroma content, and those from Linchuan County had the lowest aroma content. The esters content of Hongyang from 19 regions ranged from 2.3 to 169.7 $\mu\text{g} \cdot \text{kg}^{-1}$, among them, the fruits from Nandan of Hechi City, Mochuan of Xin'an County in Guilin City had the highest aroma content, and those from Longsheng of Longsheng County in Guilin City had the lowest esters content. The main esters in Hongyang were ethyl butyrate, methyl butyrate, ethyl caproate, methyl benzoate, ethyl acetate, butyl butyrate, and methyl quillate etc. The terpenes content of Hongyang fruits from the 19 regions ranged from 0.9 to 134.5 $\mu\text{g} \cdot \text{kg}^{-1}$. The fruits from Rongjiang of Xin'an County in Guilin City had the most abundant terpenes content, followed by those from Sishui of Longsheng County in Guilin City, and the fruits from Zhongshan of Hezhou City had the lowest terpenes content. The high content of terpenes of Hongyang fruits from the 19 regions were eucalyptol, *D*-limonene, 3-carene, *o*-cymene, γ -Terpinene, β -Pinene etc. Some terpenoids were only detected in the fruit from a few areas. The principal component analysis (PCA) showed that the fruits from Sishui Township in Longsheng County, Rongjiang Town in Xing'an County, Nanbianshan Township in Lingui District, Nandan County in Hechi City and Luocheng County had higher aroma scores. 【Conclusion】 The aromatic constituents of the Hongyang kiwifruits from the different regions were analyzed. The comprehensive analysis showed that the aroma of kiwifruit was better in Rongjiang Sishui of Longsheng County, Nanbianshan of Lingui District, Nandan County and Luocheng County, indicating that the climate and soil conditions were favorable for the formation of aroma. The results also showed that the fruits from Dongshan of Quanzhou County in Guilin City and Xiaxia of Linchuang County in Guilin City had the lowest aroma where the conditions might not be suitable for the formation of kiwi aroma. In addition, the climate of some growing areas was favorable for ester formation and some other areas for terpenoids formation. Rongjiang of Xin'an County in Guilin City would be conducive to the formation of esters and terpenoids. The results could provide certain reference for selecting suitable areas for planting kiwifruit in Guangxi.

猕猴桃又称奇异果(kiwifruit),果实风味独特,富含膳食纤维、维生素、蛋白质和矿物质等,营养价值极高,被誉为“水果之王”。广西是猕猴桃的原产地之一,自然条件适合猕猴桃的生长发育,并且处于低纬度地区,光能充足,雨量充沛,与其他猕猴桃产区相比,广西种植猕猴桃有早熟的优势,但由于管理水平低,单位面积产量低,品质差,产量和品质均无法满足市场需求。香气是果实风味与品质构成的重要指标,是果品多样化的特征物质,果品的风味与品质在市场上决定着品种是否具有更强的竞争优势,香气浓郁的猕猴桃更受消费者的喜爱。不同品种的猕猴桃香气不同,红阳猕猴桃是从中华猕猴桃实生后代中选出的红肉品种^[1],果实长圆柱形兼倒卵圆形,鲜果横剖面沿果心有紫红色线条呈放射状分布,口感鲜美,有香味,广西从2006年开始引进红阳猕猴桃,是目前广西地区的主栽品种^[2]。

广西的猕猴桃主产区在桂林,除桂林外,百色乐业、河池等地猕猴桃种植业也已形成一定的规模,近年来,随着猕猴桃经济效益的显现,广西猕猴桃种植面积不断扩大,不少地区的水果从业人员也都将红阳猕猴桃作为推广品种^[2-4],所以近年来红阳猕猴桃推广速度快,栽培面积逐年增长,但是不同产地的果实因土壤特性、气温、湿度、光照等种植条件的差异,

从而导致果实质量、着色、糖酸含量和香气物质等品质指标存在差异^[5-6],目前关于猕猴桃香气的研究大多集中在不同品种的比较^[7-9]和采后香气变化方面^[10-12],对于不同产地果实香气差异的研究较少,本试验利用顶空-固相微萃取/气相色谱-质谱联用技术对广西桂林、河池、百色、来宾等地的红阳猕猴桃香气物质进行对比研究,明确在不同地区猕猴桃果实香气差异,以确定红阳猕猴桃在广西的适生区,为进一步推广和应用提供技术支持。

1 材料和方法

1.1 材料和仪器

材料:供试材料主要采集于广西桂林、河池、百色等市的19个红阳猕猴桃主产基地,部分样品采集于农民基地,随机选取无病虫害、成熟度和大小相近的猕猴桃果实,每份样品3.0 kg,采集猕猴桃样品共19份(桂林12份,河池3份,乐业1份,靖西1份,贺州1份,来宾1份),采集品种均为红阳猕猴桃,果实可溶性固体物含量达到7%后采样,将样品装入自封袋于24 h内带回实验室,在室温放置直到后熟完成,检测可溶性固体物含量达到20%,即进行香气成分的提取和检测。各园区具体经纬度和采样日期见表1,各地气象参数见表2。

1.2 香气物质测定方法

采用顶空固相萃取(HS-SPME)和气相色谱-质谱联用(GC-MS)检测果实香气成分。称取50 g样品匀浆,同时加入10%的NaCl,加入0.1 mL 41 mg·L⁻¹的3-octanol溶液作为内标。每次测量称取5 g果浆于20 mL顶空瓶中,放在磁力搅拌器中设置40 °C,平衡20 min后,萃取30 min。萃取结束后,将萃取头插入气相色谱的进样口,在220 °C下解析3 min。进样口采取无分流模式。萃取头采用30 μm PDMS/DVB SPME萃取头(Supelco公司,美国),在萃取样品前萃取头在250 °C下老化30 min。采用气质联用仪对芳香物质进行分析鉴定。气相色谱型号为安捷伦7890C,质谱型号为安捷伦5975(安捷伦公司)。色谱柱为HP-5MS(30 m×0.25 mm×1.0 μm)毛细管柱,升温程序为:40 °C保持5 min,然后以2 °C·min⁻¹升至70 °C,保持2 min,以3 °C升至120 °C,再以5 °C·min⁻¹升至150 °C,最后以10 °C·min⁻¹升至220 °C,保持2 min。转移线温度为280 °C。质谱检测器采用EI模式,电压为70 eV;离子源温度为230 °C;扫描速率为2.88 scan·s⁻¹;质谱检测范围为29~540 m/z,载气为氦气,流速为1.0 mL·min⁻¹。通过与质谱数据库(NIST 2008)及有关质谱数据、保留时间(RI)、相关文献进行比对(NIST Chemistry Web Book, 2005)。

所测物质含量定义为3-辛醇的相对含量。

1.3 主成分分析方法

利用SPSS软件的因子分析对各地区猕猴桃果实香气物质进行主成分分析,利用成分得分系数矩阵计算每个成分得分,计算每个成分得分后,结合方差解释率,计算每个地区的综合得分,综合得分=w1×主成分1得分+w2×主成分2得分+w3×主成分3得分+w4×主成分4得分…,其中w表示主成分的贡献率^[13]。综合得分计算完成后,其分值越大,则说明香气越优。

计算每个地区的综合得分,经计算后表明桂林市的龙胜县泗水乡、兴安县溶江镇、临桂区南边山乡、河池市南丹县、罗城县的猕猴桃香气综合得分较高(图4)。

3 讨 论

香气是果实风味和品质的重要指标,可以间接反映出水果及其加工产品的口感及风味,而且在提升消费者口碑及市场竞争力方面也起关键性的作用,是果品多样化的特征物质,也是猕猴桃种植需要关注的焦点。如猕猴桃品种徐香,因其浓郁的香味,深受广大消费者喜爱,目前是陕西产区的主栽鲜食品种;又如著名的品种阳光金果,也是因为具有十分浓郁的香味而深受消费者喜爱,市场上价格也较高。研究表明,不同种质的猕猴桃果实香气成分的种类和含量不同会导致果实的风味不同。目前已从美味、中华、软枣、毛花等不同种类的猕猴桃果实中鉴别出100多种香气物质,其中以来源于脂肪酸途径的酯类、醛类和醇类物质含量较高,大部分猕猴桃品种测定出的香气物质种类介于30~50种之间,少数组品种有50~80种,其中,酯类芳香物质是猕猴桃特征香气的主要成分。如董婧等^[17]在6个中华猕猴桃品种中共鉴定了92种香气化合物,香气成分种类介于17~44种之间,其中翠玉、金桃和金艳中香气成分主要是酯类化合物,楚红和东红的香气成分分别以

醛类和萜类为主,而西选二号的香气成分由醛类和萜类组成;除品种外,不同地区由于海拔、光照、气温、降雨量及土壤条件等生长环境的不同,果实品质也存在显著差异,本研究对广西19个种植区的红阳猕猴桃的香气品质进行了较全面的研究,从19个地区的红阳猕猴桃中检测到了71种香气物质,19个地区没有共有的香气成分,从所占百分比上看,所有产地的红阳猕猴桃都以酯类或萜类物质为主,在不同的地区呈现不同的香气特征,有12个产区的红阳猕猴桃以酯类物质为主,酯类物质一般呈果香味,这12个产区的猕猴桃可认为是果香型香气,7个产区(河池市南丹县,桂林市资源县,兴安县溶江镇,龙胜县龙胜镇,灵川县下辖乡,全州县和龙胜县飘里镇)的红阳猕猴桃以萜类为主,萜类含量占总香气的50%以上,萜类物质一般呈花香型,这7个产区的猕猴桃可认为是花香型香气,但是有些地区可能是因为酯类含量相对较低所以萜类占比就相对较高。

从含量上看,11个产区的红阳猕猴桃香气成分含量最高的是丁酸乙酯,这与前人^[18~20]研究结果相一致。与Lan^[8]的研究较接近,Lan^[8]在23个猕猴桃主栽品种中检测到了172种香气成分,其中丁酸乙酯、

(E)-2-己烯醇和(E)-2-己烯醛含量较高,认为是大部分品种的主要香气成分。丁酸乙酯是大部分水果的香气成分,呈果香,甜香,在本研究中也检测到了丁酸乙酯是红阳的主要成分。(E)-2-己烯醛是具有青草气味,也是一种天然的防腐杀菌剂,可抑制黄曲霉菌,草莓炭疽病菌等^[21],在本试验中,只在河池金城江区和南丹县,靖西市南坡乡3个地区的红阳猕猴桃检测到了(E)-2-己烯醛,且含量较低,这可能是红阳猕猴桃果实抗病性较差的原因之一。所有地区的红阳都没有检测到(E)-2-己烯醇,且本研究中有5个地区(桂林市资源县,全州县,龙胜县飘里镇,龙胜县泗水乡和龙胜镇)的猕猴桃香气物质以桉油精含量最高,桉油精又称桉树脑、桉油醇,是一种单萜,有与樟脑相似的气味,孙阳^[7]在软枣猕猴桃中也检测到桉油精。

在各种植区中,河池罗成县、兴安县漠川乡、南边山乡的红阳猕猴桃酯类含量较高,但萜类含量较低,果香浓郁,河池市南丹县、桂林市兴安县溶江镇、桂林市全州县、龙胜县泗水乡的萜类物质含量较高,呈花香型特点。而桂林兴安县溶江镇的酯类和萜类物质种类和含量都较为出色,特别是总香气和萜类物质含量远远高于其他地区,最能体现品种特性,是猕猴桃香气最优的产地,这可能是溶江镇靠近灵渠和榕江,三面环山,形成了独特的小气候。同时也说明红阳猕猴桃同时具有较丰富的酯类和萜类合成相关的遗传基础,但是在不同的地区不同气候条件下最终影响了香气的种类和含量。采自贺州市钟山镇花乡的猕猴桃总香气含量也较高,此地也是三面环山,形成独特小气候,较适宜猕猴桃的生长。此外,百色乐业县猕猴桃香气含量虽然不高,但是香气种类最多。主成分分析表明桂林市的龙胜县泗水乡、兴安县溶江镇、临桂区南边山乡、河池市南丹县、罗城县的猕猴桃香气综合得分较高,说明香气较优,与香气的含量和种类分析基本一致。

综合数据,广西桂林市兴安县溶江镇和漠川乡、龙胜县泗水乡、临桂区南边山乡、河池南丹县、罗城县的猕猴桃香气较优,说明气候环境和土壤条件等都比较有利于猕猴桃的香气形成和积累。

4 结 论

广西是猕猴桃的原产地,气候适合猕猴桃的种植,且地处低纬度地区,猕猴桃成熟早,发展猕猴桃

产业具有季节优势,但是由于果实品质低,一直缺乏市场竞争力。了解了红阳猕猴桃在广西不同地区的主要果实品质表现,为确定红阳猕猴桃在广西的适生区提供一定的参考意义。可依据猕猴桃的品质,对种植区进行分级,推出具有区级特色的代表猕猴桃,形成地标产品,构建自主猕猴桃品牌及战略,引导技术、人才、资本等要素向优势区聚集。桂林市兴安县溶江镇的红阳猕猴桃香气指标远超其他地区,可把此地打造出品质优异的红阳猕猴桃产区。
